An Introduction to Space

Demo Library | Science; Astronomy

Our moving neighbourhood

The solar system contains the Sun, planets, moons, and many smaller objects. Gravity influences their motion. Astronomy uses observation and physical models to understand these objects.

Looking carefully

A telescope collects light. Scientists compare observations over time, looking for patterns and testing explanations. A useful observation includes both a measurement and an estimate of its uncertainty.

Questions lead to science

Why do some planets have rings? How do stars change? A good science question can be investigated with evidence. Curiosity becomes knowledge when an explanation survives careful testing.
