Python for Curious Minds

Demo Library | Technology; Programming

Small programs, useful results

A computer program is a set of instructions. Python lets us express those instructions in a readable way. Start with a small problem: count files, rename photographs, or organise a reading list.

Store, repeat, decide

Variables store values. Loops repeat an action. Conditions choose which action to take. Combining these ideas creates useful software without needing a large program.

Build a tiny catalogue

Read filenames from a folder, collect the title of each book, and write the results to a CSV file. A list holds the records while a dictionary gives each record named fields. Test the program with an empty folder as well as a full one.
